Dear Valued Customer:

AmTopp stretch films are made with Polyethylene resins, stable and inert products, and they should not deterioration in the physical properties even shown discoloration sometimes related to the thermal stablizers used in the Polyethylene resins. In general, we still recommend customers to use our stretch film within six month of purchase to avoid film discoloration. AmTopp stretch Film will not ship films over one year old.

However the storage environment and condition could affect film performance. We recommend that films should put in dry, in door and moderate temperature less than 100 degeed. For the UV Films (outdoor application), should keep the black color film cover the products before using.
