*Signature not required if submitted online.		

Section II Service Line Inventory Summary

Do **NOT** use this form if you have any lead, galvanized requiring replacement, or unknown service lines.

Certificate of Accuracy: Our water system has conducted an inventory of our service lines. As of today, 10/11/2024, our water system does not have any lead service lines. If you have any questions, please contact Schannen Weinmann. A service line inventory of the entire service area including both the **system-owned and customer-owned service lines** has been completed and verified following review of previous materials evaluations and all available records, maps and information on permits, codes, and long term employee statements to make a determination of that all service line material at time of submittal.

Additionally, the supplier certifies all service lines have been determined through an evidence based record, method, or technique to be "Non-Lead" and has not identified any "Lead" or "Galvanized Requiring Replacement" or "Lead Status Unknown" service lines as defined below: "Lead" means where all or a portion of the service line is lead. "Galvanized Requiring Replacement" means a galvanized service line that is known to have been downstream from a lead service line in the past or is unknown to have been downstream of a lead service line currently or in the past. "Lead Status Unknown" means a service line material that is not known to be lead, galvanized requiring replacement, or non-lead.

Furthermore, an inventory listing each service line, including its material and the verification method used to determine the

Total Number Service Lines in the Distribution System at Time of Submittal	16
Total Number of Non-Lead Service Lines in the Distribution System at Time of Submittal	16

Describe in Detail Below ALL of the Methods Used to Make the Non-Lead Service Line Material Determination, including which Records were Reviewed and if any Additional Investigation Methods were used:

- All available records for the Inteplast Group's water system were reviewed as part of the review process.
- A statement from a worker employed since July 1992 confirmed that all main lines and service lines entering the buildings are constructed of stainless steel.
- Based on records, all buildings within the Inteplast Group water system area were constructed after 1992, ensuring compliance with applicable building standards post-dating the Federal and Texas state lead ban.
- The system area was verified using a Inteplast Potable Water Main Line distribution map provided by Inteplast Group. This was cross-referenced with aerial imagery from 12/31/1989, obtained through the Google Earth, confirming no development existed in the system area prior to that time.

Inventory completed in collaboration with WSP.
